# HIPswitch 250 Series

Zero Trust Identity Defined Networking (IDN) for Commercial and Industrial deployments

## IDN Overview

IDN eliminates the complexity, cost, and exposure of traditional IP networks. With IDN, our customers accelerate resource provisioning and eliminate the network attack surface by enabling peer-to-peer, zero trust overlay networks that are remarkably simple to deploy and maintain.

All devices in an IDN overlay transparently authenticate and authorize network connections before data transport, making the network invisible and inaccessible by any unauthorized devices. Segmentation is made simple, and administrators can easily connect, encrypt, failover, and disconnect device communications across any network without disrupting or changing existing infrastructure.

-  **97% Faster Resource Provisioning Time**
-  **50% Lower CapEx and OpEx**
-  **Millisecond Failover with Link Management**

## HIPswitch 250 Overview

The HIPswitch 250 is a ruggedized industrial IoT edge gateway that makes it remarkably simple to connect and protect IoT endpoints, while securely collecting data. Its port dense design with SFP, Ethernet, Serial-over-IP, dual cellular modems, link management, and Power-over-Ethernet capability eliminates the cost and complexity of having separate switches, VPNs, Firewalls, cellular modems/routers, and APNs.

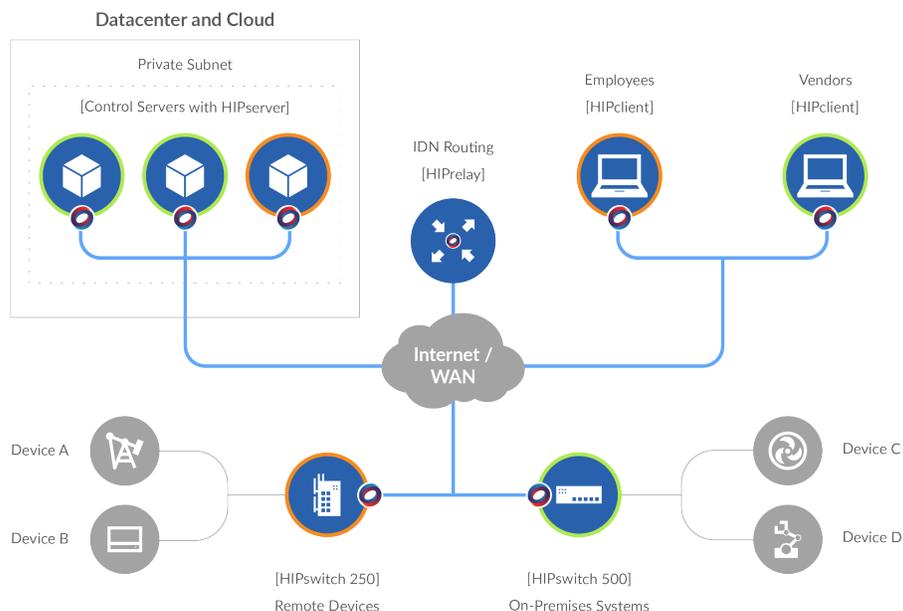

Unlike traditional IT alternatives, the HIPswitch is very easy to deploy and manage, is network and transport agnostic, and requires little to no change to existing infrastructure. Our customers can now rapidly join all ICS/SCADA, BACnet, payment systems, and other endpoints to a private and segmented overlay network in minutes.

Like all IDN enforcement points, the HIPswitch 250 serves as the network boundary and security perimeter for endpoints, which removes the complexity associated with traditional network and security methods. All connected and protected devices behind the HIPswitch 250 are cloaked and can't be discovered or reached by unauthorized devices, eliminating the network attack surface. Our customers now have a plug and play design with an optional cellular modem configuration that makes universal connectivity and segmentation across all networks simple, fast, and extremely cost-effective.

FEATURES	BENEFITS
Zero Trust Policy Enforcement	The HIPswitch enforces whitelisted network and security policy for trusted and protected endpoints in the IDN overlay, making it simple to connect and protect any IP-enabled device. Revocation of device access is instant.
Plug and Play Deployment	Provisioning the HIPswitch takes less than a minute and requires little to no changes to existing infrastructure. It can also be pre-provisioned for deployment by non-technical staff to accelerate the time to connect, protect, and segment.
Software Defined Perimeter	As a software defined gateway for protected devices, the HIPswitch becomes both the network boundary and security perimeter. This eliminates the complex, error-prone, and ineffective network and security controls of traditional IT solutions.
Cloaking	Cloaked endpoints and networks have no visible TCP/IP footprint and are invisible to the underlying network and any untrusted devices or systems, meaning attackers cannot discover or hack protected endpoints.
Universal Connectivity and Peer-to-Peer Encryption	IDN delivers private wide-area overlay networks that makes it simple to connect privately-addressed devices on separate Layer 2 and Layer 3 networks. AES-256 encryption for all sessions is on by default.
Network Resiliency and Availability	Traffic flows between distributed HIP Services can be moved instantly without disrupting application sessions to enable fast and predictable failover, disaster recovery, and quarantine.
LAN and WAN Micro-Segmentation	Secures north-south and east-west traffic in any environment - physical, virtual, and cloud - across Wi-Fi, cellular, and Ethernet networks. Provides authenticated and verifiable device-level access control that can't be spoofed or violated.
Autonomous Operation	Ensuring the highest level of security, the HIPswitch is managed only by Conductor with no local administration. No network traffic flows through the Conductor, allowing for autonomous and continuous operation.

## Deployment

- Simple policy orchestration of enforcement points within a unified overlay architecture that's network, platform, and transport agnostic.
- Simplify your network. Organizations use IDN for secure peer-to-peer connectivity and segmentation that traverses existing switching and routing infrastructure across all LAN WAN, and Internet environments.
- Intelligent link management between multiple wireless and wired options ensures high availability and resiliency.
- Simple and cost-effective to acquire, deploy, and maintain to save time, money, and personnel resources.

## Value Licensing

- Uniform software pricing regardless of platform or environment creates predictability
- No-charge software portability delivers agility to adapt to changing requirements
- HIPswitch throughput 'bursting' without penalty eliminates surprise costs
- High Availability: No charge for HA software subscriptions

“In order to provide highly available and secure connectivity across our remote and distributed energy network, we needed a better approach than traditional routing, VPNs, and APNs. The HIPswitch 250 did the job. We now have secure and highly available connectivity, with all our systems segmented in their own overlay network, which makes remote administration simple, available, and very cost-effective.”

Lead Network Architect, Regional Energy Utility

## Summary

IDN enables borderless, zero trust overlay networks with point-and-click simplicity. It's now simple to create segmented and private networks spanning on-premises, remote, and cloud environments, with granular access control for each connected resource. With IDN's unique overlay technology, our customers can start small and quickly scale and automate their segmentation architecture, without having to change their existing networking infrastructure. The results? Provision, segment, and revoke endpoints 97% faster than alternatives, while reducing the attack surface by up to 90%. With simple segmentation, built-in peer-to-peer encryption, cloaking, and universal connectivity and mobility, IDN delivers a more resilient, flexible, and extremely secure architecture.
